- 07 Stage 5A — Cloud Onboarding (deployment = cloud)**
- 08 Stage 5B — On-Premises Onboarding (Perpetual)**
- 09 Stage 6 — Life as a Customer**
- 10 Touchpoint Matrix (who gets what, when)**
- 11 Flow Guarantees (the rules that never bend)**

1. The Journey at a Glance

SmartEPT sells one all-features product two ways. Every customer walks one of two roads after deciding to pay, and both start at the same front door:

PROMOTE → VISIT smartept.com → EXPLORE (pricing slider, FAQs) → one of:

- **(A) Free Trial road** — trial sign-up (email OTP) → 7-day SmartEPT Cloud trial → convert to paid from the portal.
- **(B) Direct Buy road** — /buy pay-first cart → pay → instant activation.
- **(C) Quotation road** — quote raised (self-serve, from the portal, or by sales for a prospect) → management pays the quote's pay link → same activation.
- **(D) Sales-assisted / Credit road** — admin creates the order; provisioning happens on the first rupee received (Paid / Partial / even ₹0-due credit by commercial judgement); balance is followed up manually.

Then, by deployment:

- **CLOUD** → tenant console auto-provisioned at [admin.smartept.com/\(slug\)](https://admin.smartept.com/(slug)) → one-click SSO from the client portal → agents installed on employee PCs → live monitoring.
- **ON-PREMISES (Perpetual)** → installer + licence downloads from the portal → installed on the client's own server → 7-day evaluation auto-starts → machine fingerprint sent to Ametecs → node-locked `.lic` issued from Central → imported → ACTIVE forever, fully offline.

And for life: renewals (cloud) / AMC (on-prem) → automated dunning → upgrades → storage top-ups → support → and, at the very end of a lapsed relationship, grace → suspension → purge.

The single non-negotiable money rule underneath everything: **all payment state is computed from the payments ledger (`order_payments`)** through one door —

`BillingService::recordPayment()` — and **provisioning fires on the first verified money**, never on a promise.

CONSOLIDATED — Visitor to Lifetime Customer

2. Stage 0 — Promotion & the First Visit

Actors: prospect, marketing, sales.

1. Promotion (ads, LinkedIn, referrals, WhatsApp) points to **smartept.com** — the branded landing page (Landing CMS-managed; hero price is single-sourced from the entry pricing band, so marketing price and checkout price can never disagree).
2. The visitor explores: feature sections, the **interactive pricing slider** (On-premises tab: one-time perpetual price, progressive milestone interpolation — 61 users shows ₹44,400, not a band jump; Cloud Hosting tab: per-user/month by volume band with Quarterly 0% / Half-Yearly –10% / Annual –25% advance pricing), FAQs, and legal pages (Terms, Privacy, Refunds — Razorpay-compliant).
3. Exit ramps from the landing page: - **Buy a licence** → /buy with the slider's user count carried across (/buy?kind=perpetual&users=61). - **Start a 7-day free trial** → the client sign-up page. - **WhatsApp lead form** → opens WhatsApp chat AND silently records the lead in Central → Leads with an instant email to sales (fire-and-forget; never blocks the visitor). - **Custom quote** (above the last priced milestone, e.g. 200+ users) → WhatsApp contact; sales takes the Quotation road.
4. Sales follows up leads from Central → Leads (status pipeline, notes).

3. Stage 1 — Road A: the Free Trial (Cloud)

Actors: prospect ("owner" user), system.

1. Sign-up form: company name, contact name, work email, phone, chosen password. An invisible **honeypot** field silently swallows bots (fake success, no OTP, no email).
2. **Email OTP gate:** a 6-digit code is emailed (10-minute validity). **Nothing is created before the code verifies.** Wrong/expired code → clear error, no account.
3. On verify (single DB transaction): Tenant (status `trial`, deployment `cloud`), 7-day trial provision, and the portal **owner** login — email pre-verified, GST state captured (decides CGST+SGST vs IGST later), terms acceptance timestamped. The user lands signed-in in the **client portal**.
4. Trial experience: portal shows licences, downloads, storage, invoices, tickets, buy/upgrade. The trial is a lead in the sales pipeline from day one.

5. Automated trial dunning: reminder emails at **3 / 1 / 0 days** before expiry. Expired trials are eventually purged by the lifecycle ladder. Conversion is one click: **Buy from the portal** (Road B mechanics, same pricing engine).

4. Stage 2 — Road B: the Direct /buy Pay-First Cart

Actors: buyer, system, payment gateway.

1. `/buy` — one screen, everything live: **How you buy** (Rent·Cloud vs Own·Perpetual), **Currency** (₹ INR · GST invoice / \$ USD · export invoice), **Monitored users** (price recalculates instantly — perpetual uses the same progressive interpolation as the backend; cloud shows per-user/month × cycle), **Advance payment** cycle (cloud only), optional **Remote Assisted Setup** (₹5,000 covers 30 devices, +₹100/extra device), **Coupon** (the box only appears when a live coupon exists; exclusive personal offers auto-apply on email entry), and the GST-correct total (CGST+SGST for Telangana, IGST for other states, 0% for USD export).
2. Buyer fills company + contact + email + **their own password** + state (+ optional GSTIN, validated against the state code) and accepts Terms/Refunds.
3. Submit → tenant is created in status **pending** with a portal login, and an order + **pay link** is generated. The browser goes straight to payment: **Razorpay** (INR — UPI/cards/netbanking; smartept.com is a Razorpay-verified website) or **Stripe** (USD international cards).
4. **Payment captured** (gateway webhook `payment.captured` or return-flow verification) → `recordPayment()` → the golden chain fires automatically, same minute: - licence issued (`SEPT-XXXX-...` key; kind subscription or perpetual), - tenant flips **active**, - **GST tax invoice** cut with an FY-consecutive number + receipt, emailed, - coupon redemption counted, - cloud console provisioning kicked off (cloud) — and the buyer is **auto-signed-in to their portal**.
5. **Abandoned buys are rescued**: an order left unpaid ~3 hours gets an automatic reminder email with the pay link; the buyer can also sign in any time and find the order waiting (their password already works — pay-later recovery for free).

5. Stage 3 — Road C: Quotations

Three doors, one engine (identical pricing, quote numbers **EPT-Q-FY-...**):

1. **Portal self-quote** — a manager configures users/kind in the portal and raises a **quotation** instead of paying (requested_by recorded). They get a printable branded quote + a **pay link for management**. The moment management pays it, the same golden chain activates everything. A locked-in coupon on a quote is honoured even if the code expires meanwhile.
2. **Admin prospect quote (one screen)** — sales creates prospect tenant (status pending) + quote together for a brand-new company; email optional-send; the tenant self-activates when paid; portal owner auto-created on provisioning.
3. **Public/custom** — above the last priced milestone the system refuses to price and routes to sales (WhatsApp) for a custom quotation.

4. Unpaid quotes are **chased automatically** (quote-chaser dunning) and appear in the MD's daily money digest.

6. Stage 4 — Road D: Sales-Assisted Orders & Credit

1. Admin (super/sales) raises an order for an existing client from Orders & Payments; records money via **Mark Paid / Partial / Due** (manual gateway with method noted).
2. **Credit is a commercial judgement**: provisioning fires on the FIRST money recorded — even ₹0-due if management says so. The client goes live; the **balance** rides on the order.
3. **Credit Clients** screen tracks every provisioned-on-credit balance with payable-by dates; overdue turns red as a **manual follow-up reminder only** — nothing auto-locks a credit client. The original pay link stays alive and collects exactly the balance; **Record balance** logs instalments (each on the ledger).
4. Refunds/corrections go out as **credit notes** (printable), never by deleting money documents.

7. Stage 5A — Cloud Onboarding (deployment = cloud)

1. On first money, Central calls the product server's provisioning API (secret-signed; Product URL + secrets configured in Central Settings) → a **tenant workspace** is created on `admin.smartept.com` with the client's **slug** (branded, tenant-locked login page at `admin.smartept.com/slug`).
2. The portal shows the **hosted console** card; **one-click SSO** signs the owner into their console (HMAC-signed ticket — no password typed).
3. Company setup in the console: organisation structure (branches/departments/teams/designations/shifts), users & roles (9 system roles + custom), policies (12 types with DEVICE>EMPLOYEE>TEAM>DEPARTMENT>BRANCH>COMPANY precedence), holidays, biometric devices if used.
4. **Agent rollout**: download the Windows agent from the portal/console → install on employee PCs → each employee signs in → device registers (encrypted device token) → **consent**

screen (hash-bound to the policy version) → tracking starts per policy. Optional **Gate-to-PC**: no work session until the biometric door IN punch.

5. Seats are enforced server-side against the licence; storage = 500 MB pooled per user included, additional at the slab rates (₹3/2.5/2 per GB/month, 50 GB minimum) — usage visible in the portal, quota auto-trims oldest evidence at the cap.
6. Suspension control stays with Central: suspend/enable pushes to the cloud console instantly (suspended tenant = login hard cut-off).

Stage 5A — Cloud Onboarding

8. Stage 5B — On-Premises Onboarding (Perpetual)

1. After payment the portal's **Downloads** area serves the product installer package (download-logged, quota-guarded) — the price already included the first 12 months of updates & support.

2. Client (or Ametecs, if Remote Assisted Setup was bought) installs the console on the client's own server — Windows/Laragon/IIS or Linux/Nginx — and the **7-day evaluation starts automatically** (full features, no licence file yet).
3. Licensing (fully offline, node-locked): the console's Licence screen shows the server's **machine fingerprint** (one-click copy) → client sends it to Ametecs → Central issues the **.lic file** (RSA-2048-signed payload: key, company, device limit, kind perpetual, no expiry, fingerprint) → client imports it → status **ACTIVE**, forever, with no internet required. The product only carries the public key (SourceGuardian-protected) — it can verify but never forge.
4. Wrong/replaced hardware later → Central's **release-binding / shift-machine** actions re-issue for the new fingerprint (history kept; server-mismatch attempts trip a fraud alert).
5. Agent rollout and company setup proceed exactly as in Cloud (the console is the same product).
6. **AMC (optional, from Year 2)**: 18% per year of the **prevailing progressive price for the client's user count** — quoted and invoiced from Central; keeps updates & support flowing.

Stage 5B — On-Premises (Perpetual) Onboarding

9. Stage 6 — Life as a Customer

Renewals (cloud): subscriptions run Quarterly / Half-Yearly / Annual in advance. **Dunning** emails at 30/15/7/3/1/0 days before expiry (all deduplicated), then a **grace ladder** after expiry;

persistent non-payment → suspension → eventually the purge window closes the account (**purged**). One pay-link click at any point renews and re-activates.

Upgrades: cloud capacity rises **mid-period pro-rata** — the client pays only the remaining-days difference and the seat limit rises immediately. Perpetual capacity upgrades are priced from the same progressive engine at prevailing rates.

Money & compliance throughout: every rupee lands on the ledger; GST invoices FY-consecutive (reset 1 April, row-locked); amount-in-words; USD exports at 0% GST with the live twice-daily FX rate; accountant reports and the **MD daily money digest** summarise it all.

Self-service throughout (portal): buy/renew/upgrade/quote, invoices & receipts, downloads, storage meter, billing profile, support tickets, **forgot-password by email OTP** — with every email leaving via the client company's own SMTP when configured, else the Ametecs default relay.

Support & accountability: in-console Help & Troubleshooting (System Health), audit trail of every admin action, screenshot/evidence viewers access-logged, Danger-Zone data clearing OTP-protected with auto-backup.

Stage 6 — Renewals, Dunning & End-of-Life

10. Touchpoint Matrix (who gets what, when)

Moment	Email	WhatsApp*	In-app
Lead form submitted	Sales alert	Chat opens	Central → Leads
Trial OTP / trial reminders 3-1-0	✓	—	Sign-up page / portal
Order created / abandoned ~3h	Pay-link rescue	✓	Portal order card
Payment captured	Invoice + receipt + welcome	✓	Auto-login, licence live
Quote raised / chased	Quote PDF + pay link	✓	Portal quotes
Renewal dunning 30-15-7-3-1-0 + grace	✓	✓	Portal banner
Credit balance overdue	Manual follow-up	Manual	Credit Clients (red)
Password reset (portal & console)	OTP via company SMTP chain	—	Login cards
MD daily digest (after 07:00)	✓ to MD	—	—

*WhatsApp touchpoints require the Interakt integration to be active in Settings.

11. Flow Guarantees (the rules that never bend)

1. **No money, no provisioning** — activation only through `recordPayment()` on the ledger (credit's ₹0-first-money is an explicit management act, still through the same door).
2. **No verified email, no trial** — OTP before any trial account exists.
3. **No ₹0 lifetime licence** — Custom-Quote counts cannot price, cannot order, cannot activate.
4. **Backend prices, browser displays** — every displayed price is recomputed server-side on submit.
5. **Money documents are never deleted once money exists** — corrections by credit note; only ₹0-ledger test garbage is deletable (super admin, audited).
6. **Only licence metadata crosses Central ↔ Product** — client monitoring data never leaves the client's deployment.
7. **Consent before tracking** — the agent tracks only after the employee accepts the policy-bound consent, and transparency screens stay available to the employee.
